

## wk5\_overloads\_lab\_pwiese

Starting with the files provided for the **Account** class (representing a person's checking & savings accounts), add the following functions to the class definition:

- overloaded = operator, which assigns the values for checking and savings balances from the Account argument to the calling Account
- overloaded == operator, which checks to see if 2 Accounts have the same account number
- overloaded < operator, which checks to see if the total of the checking and savings balances in the calling Account are less than the total of the argument Account
- overloaded <= operator, which checks to see if the total of the checking and savings balances in the calling Account are less than or equal to the total of the argument Account
- overloaded >= operator, which checks to see if the total of the checking and savings balances in the calling Account are less than or equal to the total of the argument Account

BE SURE the testAccount.cpp file tests ALL overloaded operators!
