

wk4_helpers_lab_pwiese

Design, implement and test a class, **Employee**, that will contain minimal information about someone working for your company.

The following information will be kept about each employee:

- first name

- last name

- email address

- telephone number

Your class should have two constructors: one that is a default constructor and one that accepts just the last name and email address.

There should be accessor and mutator functions for all member variables.

There should be helper functions to validate the input of the value for the member variables:

- First names and last names should be only letters of the alphabet.

- Email addresses must contain only one @ and at least one period.

- Telephone numbers should contain exactly 10 digits.

Be sure your driver file tests all ways the user could get the values right and wrong!
